

ABSTRACT OF THE DISCLOSURE

The present invention relates to a portable information terminal apparatus for additionally displaying information about other programs broadcast in the same time slot as a user-selected program. A TV program recording preset program under control of an I/O control program receives input of a user-selected start time of a given TV program. In turn, the TV program recording preset program extracts from a program list memory not the user-selected time but the start and end times of the TV program relative to the selected time, and retrieves information about all TV programs to be broadcast between the extracted start and end times so as to create a table of TV programs available in the designated time slot. The table is output to a display unit for display under control of the I/O control program.
